## neoshorthands

### Abstract

This is the documentation of the package neoshorthands. It is a tool to use the powerfull Neo-layout with Xalate. It does not do very much, but mapping many of the usefull symbols to TeX commands. will be converted to \tau. This package does *not* define fancy commands and is therefore very robust. Just say \usepackage{neoshorthands}. If you find any incompatibilities with any package, pleas drop me a mail and maybe I can take care of it.

The single command of this package is \neoshorthand{ }\tau wich maps the command onto the given symbol. You can add your own definitions, but please consider to send me the code so I could add it to the package. Only with the help of many people, this package can be usefull for many people!

Special thanks to the guys on german TEX mailinglist tex-d-1 who gave me the code (I copied it from the alttex package).

```

# contribution

If you want to change a certain symbol in your document, you have to use the command \neoshorthand, as \sh will no longer be defined after this package is loaded. I think, the name is too good to be blocked by such a function. Thanks to all people that have submitted additions:

Dennis-f
